## Introduction

The Zylin ZPU is the worlds smallest 32 bit CPU with GCC tool chain. The ZPU is a small CPU in two ways: it takes up very little resources and the architecture itself is small. The latter can be important when learning about CPU architectures and implementing variations of the ZPU where aspects of CPU design is examined. In academia students can learn VHDL, CPU architecture in general and complete exercises in the course of a year. The current ZPU instruction set and architecture has not changed for the last couple of years and can be considered quite stable. This shall be presented in detail the following chapters.

Part of this work is based on previous work done by Álvaro Lopes - [alvieboy@alvie.com](mailto:alvieboy@alvie.com) (see legal notice) on the ZPUino – a derivative work of the original ZPU core by Øyvind Harboe - [oyvind.harboe@zylin.com](mailto:oyvind.harboe@zylin.com). The original ZPUino can be found on the internet on the following website: <http://www.alvie.com/zpuino>. Furthermore, the original ZPU and the “ZPU Project” can also be found on the internet on the following website: <https://github.com/zylin/zpu>.

## Instruction Set Summary

### Stack Operation Definitions

TOS = Top Of Stack = SP  
 mem[SP] = valid data = stackA

PUSH:

SP = SP - 1;  
 mem[SP] = data;

POP:

data = mem[SP];  
 SP = SP + 1;

### Memory Operations

PC : Accesses memory in 8 bit cells

SP : Accesses memory in 32 bit cells

NOTE: although PC points to 8 bit cells, the ZPU state machine always fetches 32 bit words and internally breaks down the words into bytes. The Stack Pointer, however, is a pointer to 32 bit cells which are aligned on 4-byte boundary, i.e. SP results in a memory fetch to address 4\*SP and.

NOTE: the CPU implementation in VHDL is such that the TOS

(stackA) and mem[SP+1] (stackB), i.e. both instruction operands, are normally not immediately written back to memory in order to save CPU cycles. Care should be taken while reading the code to exactly understand when (due to state transitions) the stackA and/or stackB need to be written back to memory. See also instruction description below for a better understanding.

This means that stackA and stackB internal variables are actually cached versions of the corresponding memory positions. When SP changes, the stackA and stackB have to be updated accordingly and so does the memory positions corresponding to stackA (SP) and/or stackB (SP+1) before SP is updated.

## Core instructions summary

<i>Mnemonic</i>	<i>Opcode</i>	<i>Impl.</i>	<i>Description</i>
BREAKPOINT	0000 0000	YES	Sets 'break' line to logic '1'
IM x	1xxx xxxx	YES	
STORESP x	010 $\bar{x}$ xxxx	YES	
POP	0101 0000	YES	Implemented using STORESP 0
POPDOWN	0101 0001	YES	Implemented using STORESP 1
LOADSP x	011 $\bar{x}$ xxxx	YES	
DUP	0111 0000	YES	Implemented using LOADSP 0
DUPSTACKB	0111 0001	YES	Implemented using LOADSP 1
ADDSP x	0001 xxxx	YES	
SHIFT	0001 0000	YES	Implemented using ADDSP 0
ADDTOP	0001 0001	YES	Implemented using ADDSP 1
EMULATE x	001x xxxx	YES	
POPPC	0000 0100	YES	
LOAD	0000 1000	YES	
STORE	0000 1100	YES	
PUSHSP	0000 0010	YES	
POPSP	0000 1101	YES	
ADD	0000 0101	YES	
AND	0000 0110	YES	
OR	0000 0111	YES	
NOT	0000 1001	YES	
FLIP	0000 1010	YES	
NOP	0000 1011	YES	

## Optional instructions (emulated)

<i>Mnemonic</i>	<i>Opcode</i>	<i>Dec.</i>	<i>Impl.</i>	<i>Description</i>

# Instructions Specification

## IM

OPCODE	<b>IM x</b>																
MACHINE CODE	<b>1xxxxxxxx</b>																
IMPLEMENTED	<b>YES</b>																
EMULATED	<b>NO</b>																
SP ACTION	<b>single PUSH</b>																
DESCRIPTION	Pushes immediate value into TOS																
PSEUDOCODE	<pre> if (idim='0') { // no previous IM     idim      = 1;     mem[sp+1] = stackB;     stackB    = stackA;     stackA    = {mem[sp][24:0], x[6:0]}; // sign extend     sp        = sp - 1; } else {      // previous IM     stackA    = { stackA[31:7], x[6:0] }; } </pre>																
EQUIVALENT CODE	<pre> if (!idim) {     push(x); } else {     idim = 1;     a    = pop();     push( a&lt;&lt;7 + x ); } </pre>																
INTERNAL LAYOUT	<p>PREVIOUS "IM" (idim='1'):</p> <table border="1"> <thead> <tr> <th>Before</th> <th>After</th> </tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td> <td>SP-1 → [ ]</td> </tr> <tr> <td>SP → [ ] ← A</td> <td>SP → [ ] ← A = {A[31:7], x}</td> </tr> <tr> <td>SP+1 → [ ] ← B</td> <td>SP+1 → [ ] → B</td> </tr> </tbody> </table> <p>ELSE (idim='0'):</p> <table border="1"> <thead> <tr> <th>Before</th> <th>After</th> </tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td> <td>SP → [ ] ← A = sign_ext(x)</td> </tr> <tr> <td>SP → [ ] ← A</td> <td>SP+1 → [ ] → B</td> </tr> <tr> <td>SP+1 → [ ] ← B</td> <td>SP+2 → [B]</td> </tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP-1 → [ ]	SP → [ ] ← A	SP → [ ] ← A = {A[31:7], x}	SP+1 → [ ] ← B	SP+1 → [ ] → B	Before	After	SP-1 → [ ]	SP → [ ] ← A = sign_ext(x)	SP → [ ] ← A	SP+1 → [ ] → B	SP+1 → [ ] ← B	SP+2 → [B]
Before	After																
SP-1 → [ ]	SP-1 → [ ]																
SP → [ ] ← A	SP → [ ] ← A = {A[31:7], x}																
SP+1 → [ ] ← B	SP+1 → [ ] → B																
Before	After																
SP-1 → [ ]	SP → [ ] ← A = sign_ext(x)																
SP → [ ] ← A	SP+1 → [ ] → B																
SP+1 → [ ] ← B	SP+2 → [B]																

## EMULATE

OPCODE	<b>EMULATE</b> <b>x</b>								
MACHINE CODE	<b>001xxxxx</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>PUSH</b>								
DESCRIPTION	If the instruction is not implemented in hardware, this instruction will fired-up the microcode implementation of the function. 0<= x <= 31								
PSEUDOCODE	<pre> mem[sp+1] = stackB; // save cached stackB sp        = sp - 1; // make room for push stackB    = stackA; stackA    = pc + 1; // return address pc        = 32*x;   // microcode at address 32*x fetch(); </pre>								
EQUIVALENT CODE	<i>call(32*x);</i>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td><td>SP → [ ] ← A = <b>return_address</b></td></tr> <tr> <td>SP → [ ] ← A</td><td>SP+1 → [ ] ← B</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+2 → [B]</td></tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP → [ ] ← A = <b>return_address</b>	SP → [ ] ← A	SP+1 → [ ] ← B	SP+1 → [ ] ← B	SP+2 → [B]
Before	After								
SP-1 → [ ]	SP → [ ] ← A = <b>return_address</b>								
SP → [ ] ← A	SP+1 → [ ] ← B								
SP+1 → [ ] ← B	SP+2 → [B]								

## STORESP

OPCODE	<b>STORESP x</b>												
MACHINE CODE	<b>010xxxxx</b>												
IMPLEMENTED	<b>YES</b>												
EMULATED	<b>NO</b>												
SP ACTION	<b>POP</b>												
DESCRIPTION	Pop TOS and store it at mem[SP+x]												
PSEUDOCODE	<pre> (storeSP) mem[sp+x] = stackA; // NOTE: x is always unsigned stackA    = stackB; sp        = sp + 1; (storeSP2) stackB    = mem[sp+1]; </pre>												
EQUIVALENT CODE	<pre> mem[SP+x] = TOS; pop(); </pre>												
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP → [ ] ← A</td><td>SP → [ ]</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+1 → [ ] ← A (= prev B)</td></tr> <tr> <td>SP+2 → [ ]</td><td>SP+1 → [ ] → B (fetched )</td></tr> <tr> <td>...</td><td></td></tr> <tr> <td>SP+x → [?]</td><td>SP+x-1 → [A] (modified)</td></tr> </tbody> </table>	Before	After	SP → [ ] ← A	SP → [ ]	SP+1 → [ ] ← B	SP+1 → [ ] ← A (= prev B)	SP+2 → [ ]	SP+1 → [ ] → B (fetched )	...		SP+x → [?]	SP+x-1 → [A] (modified)
Before	After												
SP → [ ] ← A	SP → [ ]												
SP+1 → [ ] ← B	SP+1 → [ ] ← A (= prev B)												
SP+2 → [ ]	SP+1 → [ ] → B (fetched )												
...													
SP+x → [?]	SP+x-1 → [A] (modified)												

## POP

OPCODE	<b>POP / STORESP 0</b>								
MACHINE CODE	<b>01010000</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>POP</b>								
DESCRIPTION	Pops value from stack								
PSEUDOCODE	<pre> stackA    = stackB; sp        = sp + 1; stackB    = mem[sp+1]; </pre>								
EQUIVALENT CODE	<pre> pop(); </pre>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP → [ ] ← A</td><td>SP → [ ]</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+1 → [ ] → A (= prev B)</td></tr> <tr> <td>SP+2 → [ ]</td><td>SP+1 → [ ] → B (fetched )</td></tr> </tbody> </table>	Before	After	SP → [ ] ← A	SP → [ ]	SP+1 → [ ] ← B	SP+1 → [ ] → A (= prev B)	SP+2 → [ ]	SP+1 → [ ] → B (fetched )
Before	After								
SP → [ ] ← A	SP → [ ]								
SP+1 → [ ] ← B	SP+1 → [ ] → A (= prev B)								
SP+2 → [ ]	SP+1 → [ ] → B (fetched )								

## POPDOWN

OPCODE	<b>POPDOWN / STORESP 1</b>				
MACHINE CODE	<b>01010000</b>				
IMPLEMENTED	<b>YES</b>				
EMULATED	<b>NO</b>				
SP ACTION	<b>POP</b>				
DESCRIPTION	Pops two values from stack and pushes first value back to stack.				
PSEUDOCODE	<pre> sp      = sp + 1; stackB  = mem[sp+1]; </pre>				
EQUIVALENT CODE	<pre> a = pop(); pop(); push(a); </pre>				
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th> <th>After</th> </tr> </thead> <tbody> <tr> <td> <pre> SP      → [ ] ← A SP+1 → [ ] ← B SP+2 → [ ] </pre> </td> <td> <pre> SP      → [ ] ← A (= prev A) SP+1 → [ ] → B (fetched ) </pre> </td> </tr> </tbody> </table>	Before	After	<pre> SP      → [ ] ← A SP+1 → [ ] ← B SP+2 → [ ] </pre>	<pre> SP      → [ ] ← A (= prev A) SP+1 → [ ] → B (fetched ) </pre>
Before	After				
<pre> SP      → [ ] ← A SP+1 → [ ] ← B SP+2 → [ ] </pre>	<pre> SP      → [ ] ← A (= prev A) SP+1 → [ ] → B (fetched ) </pre>				

## LOADSP

OPCODE	<b>LOADSP</b> <b>x</b>												
MACHINE CODE	<b>011xxxxx</b>												
IMPLEMENTED	<b>YES</b>												
EMULATED	<b>NO</b>												
SP ACTION	<b>PUSH</b>												
DESCRIPTION	Push value at mem[SP+x] into stack												
PSEUDOCODE	<pre> (LoadSP) mem[sp+1] = stackB;      // writeback cached stackB sp        = sp - 1;      // required for push (LoadSP2) read      = mem[SP+x+1]; // fetch mem[SP+x] (LoadSP3) stackB    = stackA;      // stackB is now = old stackA stackA    = read;        // stackA = mem[SP+x] </pre>												
EQUIVALENT CODE	<pre> a = mem[sp+x]; push(a); </pre>												
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td><td>SP → [ ] → A (= v )</td></tr> <tr> <td>SP → [ ] ← A</td><td>SP+1 → [ ] ← B (= prev A)</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+2 → [ ]</td></tr> <tr> <td>...</td><td></td></tr> <tr> <td>SP+x → [v]</td><td>SP+x+1 → [v]</td></tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP → [ ] → A (= v )	SP → [ ] ← A	SP+1 → [ ] ← B (= prev A)	SP+1 → [ ] ← B	SP+2 → [ ]	...		SP+x → [v]	SP+x+1 → [v]
Before	After												
SP-1 → [ ]	SP → [ ] → A (= v )												
SP → [ ] ← A	SP+1 → [ ] ← B (= prev A)												
SP+1 → [ ] ← B	SP+2 → [ ]												
...													
SP+x → [v]	SP+x+1 → [v]												

## DUP

OPCODE	<b>DUP / LOADSP 0</b>								
MACHINE CODE	<b>01110000</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>PUSH</b>								
DESCRIPTION	Push TOS again into stack								
PSEUDOCODE	<pre> mem[sp+1] = stackB;    // writeback cached stackB sp        = sp - 1;    // required for push stackB    = stackA;    // stackB is now = old stackA </pre>								
EQUIVALENT CODE	<pre> a = pop(); push(a); push(a); </pre>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td><td>SP → [ ] → A (= prev A)</td></tr> <tr> <td>SP → [ ] ← A</td><td>SP+1 → [ ] ← B (= prev A)</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+2 → [ ]</td></tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP → [ ] → A (= prev A)	SP → [ ] ← A	SP+1 → [ ] ← B (= prev A)	SP+1 → [ ] ← B	SP+2 → [ ]
Before	After								
SP-1 → [ ]	SP → [ ] → A (= prev A)								
SP → [ ] ← A	SP+1 → [ ] ← B (= prev A)								
SP+1 → [ ] ← B	SP+2 → [ ]								

## DUPSTACKB

OPCODE	<b>DUPSTACKB / LOADSP 1</b>								
MACHINE CODE	<b>01110001</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>PUSH</b>								
DESCRIPTION	Push stackB again into stack								
PSEUDOCODE	<pre> A          = stackA;  // save old stackA B          = stackB;  // save old stackB stackA     = stackB;  // new stackA = old stackB stackB     = A;       // new stackB = old stackA mem[sp+1]  = B;       // writeback cached (old) stackB sp         = sp - 1;  // required for push </pre>								
EQUIVALENT CODE	<pre> a = pop();  // get stackA b = pop();  // get stackB push(b);    // save back stackB push(a);    // save back stackA push(b);    // duplicate stackB </pre>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td><td>SP → [ ] → A (= prev A)</td></tr> <tr> <td>SP → [ ] ← A</td><td>SP+1 → [ ] ← B (= prev A)</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+2 → [B]</td></tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP → [ ] → A (= prev A)	SP → [ ] ← A	SP+1 → [ ] ← B (= prev A)	SP+1 → [ ] ← B	SP+2 → [B]
Before	After								
SP-1 → [ ]	SP → [ ] → A (= prev A)								
SP → [ ] ← A	SP+1 → [ ] ← B (= prev A)								
SP+1 → [ ] ← B	SP+2 → [B]								

## ADDSP

OPCODE	<b>ADDSP x</b>												
MACHINE CODE	<b>0001xxxx</b>												
IMPLEMENTED	<b>YES</b>												
EMULATED	<b>YES</b>												
SP ACTION	<b>POP + PUSH</b>												
DESCRIPTION	TOS = TOS + mem[SP+x]												
PSEUDO CODE	<pre>a      = mem[SP+x]; stackA = stackA + a;</pre>												
EQUIVALENT CODE	<pre>a = mem[SP+x]; b = pop(); push (a+b);</pre>

SP → [ ] ← A	SP-1 → [ ]								
SP+1 → [ ] ← B	SP → [B] ← A								
SP+2 → [ ]	SP+1 → [ ] ← B								

## ADD

OPCODE	<b>ADD</b>								
MACHINE CODE	<b>00000101</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>POP + POP + PUSH</b>								
DESCRIPTION	This instruction pops two values from stack: X and Y. It then pushes back into the stack the value given by A+B.								
PSEUDO CODE	<pre> a = pop(); b = pop(); b = b + a; push(b); </pre>								
EQUIVALENT CODE	<pre> mem[sp+1] = mem[sp+1] + mem[sp]; sp       = sp + 1; </pre>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP → [ ] ← A</td><td>SP-1 → [ ]</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP → [ ] ← A</td></tr> <tr> <td>SP+2 → [ ]</td><td>SP+1 → [ ] → B</td></tr> </tbody> </table>	Before	After	SP → [ ] ← A	SP-1 → [ ]	SP+1 → [ ] ← B	SP → [ ] ← A	SP+2 → [ ]	SP+1 → [ ] → B
Before	After								
SP → [ ] ← A	SP-1 → [ ]								
SP+1 → [ ] ← B	SP → [ ] ← A								
SP+2 → [ ]	SP+1 → [ ] → B								

## AND

OPCODE	<b>AND</b>								
MACHINE CODE	<b>00000110</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>POP + POP + PUSH</b>								
DESCRIPTION	This instruction pops two values from stack: X and Y. It then pushes back into the stack the value given by A AND B.								
PSEUDO CODE	<pre> a = pop(); b = pop(); b = b AND a; push(b); </pre>								
EQUIVALENT CODE	<pre> mem[sp+1] = mem[sp+1] AND mem[sp]; sp        = sp + 1; </pre>								
INTERNAL LAYOUT	<table border="0"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP → [ ] ← A</td><td>SP-1 → [ ]</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP → [ ] ← A</td></tr> <tr> <td>SP+2 → [ ]</td><td>SP+1 → [ ] → B</td></tr> </tbody> </table>	Before	After	SP → [ ] ← A	SP-1 → [ ]	SP+1 → [ ] ← B	SP → [ ] ← A	SP+2 → [ ]	SP+1 → [ ] → B
Before	After								
SP → [ ] ← A	SP-1 → [ ]								
SP+1 → [ ] ← B	SP → [ ] ← A								
SP+2 → [ ]	SP+1 → [ ] → B								

## OR

OPCODE	<b>OR</b>								
MACHINE CODE	<b>00000111</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>POP + POP + PUSH</b>								
DESCRIPTION	This instruction pops two values from stack: X and Y. It then pushes back into the stack the value given by A OR B.								
PSEUDO CODE	<pre> a = pop(); b = pop(); b = b OR a; push(b); </pre>								
EQUIVALENT CODE	<pre> mem[sp+1] = mem[sp+1] OR mem[sp]; sp       = sp + 1; </pre>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP → [ ] ← A</td><td>SP-1 → [ ]</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP → [ ] ← A</td></tr> <tr> <td>SP+2 → [ ]</td><td>SP+1 → [ ] → B</td></tr> </tbody> </table>	Before	After	SP → [ ] ← A	SP-1 → [ ]	SP+1 → [ ] ← B	SP → [ ] ← A	SP+2 → [ ]	SP+1 → [ ] → B
Before	After								
SP → [ ] ← A	SP-1 → [ ]								
SP+1 → [ ] ← B	SP → [ ] ← A								
SP+2 → [ ]	SP+1 → [ ] → B								

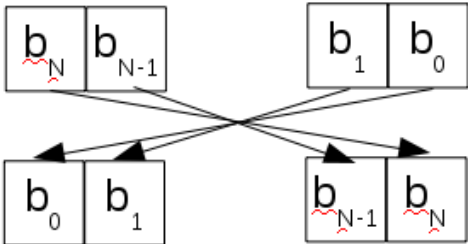

## LOAD

OPCODE	<b>LOAD</b>								
MACHINE CODE	<b>00001000</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>PUSH</b>								
DESCRIPTION	Push value at mem[stackA] into stack								
PSEUDOCODE	<pre> mem[SP+1] = stackB; SP        = SP-1; stackB    = stackA; stackA    = mem[stackA]; </pre>								
EQUIVALENT CODE	<pre> a = pop(); b = mem[a]; push(b); </pre>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td><td>SP → [ ] ← A (= mem[stackA] )</td></tr> <tr> <td>SP → [ ] ← A</td><td>SP+1 → [ ] ← B (= prev stackA )</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+2 → [B]</td></tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP → [ ] ← A (= mem[stackA] )	SP → [ ] ← A	SP+1 → [ ] ← B (= prev stackA )	SP+1 → [ ] ← B	SP+2 → [B]
Before	After

SP → [ ] ← A	SP+1 → [ ] ← B (= prev stackA )								
SP+1 → [ ] ← B	SP+2 → [B]								

## NOT

OPCODE	<b>NOT</b>								
MACHINE CODE	<b>00001001</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>YES</b>								
SP ACTION	<b>POP + PUSH</b>								
DESCRIPTION	This instruction pops one value from stack (X). It then pushes back into the stack the value NOT X;								
PSEUDO CODE	<pre> a = pop(); push(~a); </pre>								
EQUIVALENT CODE	<code>stackA = NOT stackA;</code>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP → [ ] ← A</td><td>SP → [ ] ← A</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+1 → [ ] ← B</td></tr> <tr> <td>SP+2 → [ ]</td><td>SP+2 → [ ]</td></tr> </tbody> </table>	Before	After	SP → [ ] ← A	SP → [ ] ← A	SP+1 → [ ] ← B	SP+1 → [ ] ← B	SP+2 → [ ]	SP+2 → [ ]
Before	After								
SP → [ ] ← A	SP → [ ] ← A								
SP+1 → [ ] ← B	SP+1 → [ ] ← B								
SP+2 → [ ]	SP+2 → [ ]								

## FLIP

OPCODE	<b>FLIP</b>								
MACHINE CODE	<b>00001010</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>YES</b>								
SP ACTION	<b>POP + PUSH</b>								
DESCRIPTION	<p>This instruction pops one value from stack (X). It then pushes back into the stack the value flip(X). The flip function rearranges the bits of X such that <math>\text{bit}\{n\} = \text{bit}\{L-1-n\}</math>, where L is the word length in bits.</p> 								
PSEUDO CODE	<pre>a = pop(); push( flip(a) );</pre>								
EQUIVALENT CODE	<code>mem[sp] = flip( mem[sp] );</code>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP+1 → [ ]</td><td>SP-1 → [ ]</td></tr> <tr> <td>SP → [ ] ← A</td><td>SP → [ ] ← A (= flip stackA )</td></tr> <tr> <td>SP+2 → [ ] ← B</td><td>SP+1 → [ ] ← B</td></tr> </tbody> </table>	Before	After	SP+1 → [ ]	SP-1 → [ ]	SP → [ ] ← A	SP → [ ] ← A (= flip stackA )	SP+2 → [ ] ← B	SP+1 → [ ] ← B
Before	After								
SP+1 → [ ]	SP-1 → [ ]								
SP → [ ] ← A	SP → [ ] ← A (= flip stackA )								
SP+2 → [ ] ← B	SP+1 → [ ] ← B								

## NOP

OPCODE	<b>NOP</b>								
MACHINE CODE	<b>00001011</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>NO</b>								
SP ACTION	<b>none</b>								
DESCRIPTION	No operation								
PSEUDOCODE									
EQUIVALENT CODE									
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td><td>SP-1 → [ ]</td></tr> <tr> <td>SP → [ ] ← A</td><td>SP → [ ] ← A</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+1 → [ ] ← B</td></tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP-1 → [ ]	SP → [ ] ← A	SP → [ ] ← A	SP+1 → [ ] ← B	SP+1 → [ ] ← B

SP+3 → [ ]	SP+1 → [ ] → B										

## POPSP

OPCODE	<b>POPSP</b>
MACHINE CODE	<b>00001101</b>
IMPLEMENTED	<b>YES</b>
EMULATED	<b>NO</b>
SP ACTION	<b>new stack frame</b>
DESCRIPTION	Load SP with TOS
PSEUDOCODE	<code>sp = stackA; resynch();</code>
EQUIVALENT CODE	<code>SP = TOS;</code>
INTERNAL LAYOUT	<div> <div>Before</div> <div>After</div> </div> <div> <div>-----+-----</div> <div> <div>SP → [ ] ← A</div> <div>SP+1 → [ ] ← B</div> <div>...</div> <div>SP → [ ] → A</div> <div>SP+1 → [ ] → B</div> </div> </div>

## COMPARE

OPCODE	<b>COMPARE / IPSUM</b>
MACHINE CODE	<b>00001110</b>
DESCRIPTION	<pre> c    = mem[sp]; s    = mem[sp+1]; sum = 0; while (c--&gt;0){     sum += halfword(mem[s],s);     s    += 2; }; sp      = sp+1; mem[sp] = sum; (overwrites mem[0] &amp; mem[4] words) </pre>

## SNCPY

OPCODE	SNCPY
MACHINE CODE	00001111
DESCRIPTION	<pre> c = mem[sp]; d = mem[sp+1]; s = mem[sp+2]; while ( *(char*)s != 0 &amp;&amp; c&gt;0 ){     *((char*)d++) =* ((char*)s++);     c--; }; sp = sp+3; (overwrites mem[0] &amp; mem[4] words) </pre>

## SNCPY2

OPCODE	SNCPY
MACHINE CODE	00100000
DESCRIPTION	<pre> c = mem[sp]; d = mem[sp+1]; s = mem[sp+2]; while (c--&gt;0) {     mem[d++] = mem[s++]; } sp = sp+3; (overwrites mem[0] &amp; mem[4] words) </pre>

## WCPY

OPCODE	WCPY
MACHINE CODE	00100001
DESCRIPTION	<pre> v = mem[sp]; c = mem[sp+1]; d = mem[sp+2]; while (c--&gt;0) {     mem[d++] = v; } sp = sp+3; (overwrites mem[0] &amp; mem[4] words) </pre>

## LESSTHAN

OPCODE	<b>LESSTHAN</b>								
MACHINE CODE	<b>00100100</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>YES</b>								
SP ACTION	<b>POP + POP + PUSH</b>								
DESCRIPTION	This instruction pops two values from stack: X and Y. It then pushes back into the stack the value 1 if A<B using signed comparison; otherwise it pushes back the value 0;								
PSEUDO CODE	<pre> a = pop(); b = pop(); if ((signed)a &lt; (signed)b) {     push(1); } else {     push(0); } </pre>

## HALFMULT

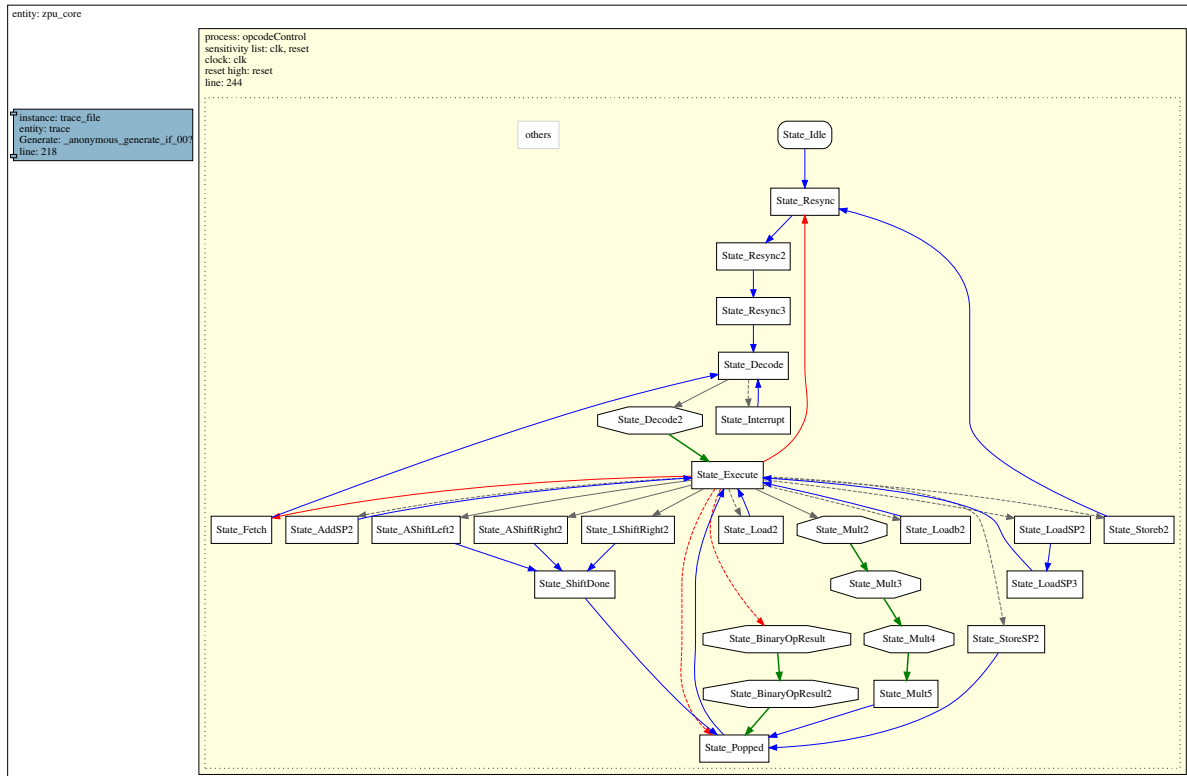

OPCODE	<b>HALFMULT</b>
MACHINE CODE	<b>00111110</b>
DESCRIPTION	mem[sp+1] = 16bits(mem[sp]) * 16bits(mem[sp+1]); sp = sp + 1;

## CALLPCREL

OPCODE	<b>CALLPCREL</b>								
MACHINE CODE	<b>00111110</b>								
IMPLEMENTED	<b>YES</b>								
EMULATED	<b>YES</b>								
SP ACTION	<b>POP + PUSH</b>								
DESCRIPTION	jumps to memory address PC + TOP, while adjusting the stack with the return address pc+1								
PSEUDOCODE	<pre> x      = stackA[L-1:0]; // (POP) L: mem address lines stackA = pc + 1;        // (PUSH) return address pc      = pc + x;        // jump to pc+x </pre>								
EQUIVALENT CODE	<pre> x = pop(); call(pc+x); // pushes PC+1 into stack </pre>								
INTERNAL LAYOUT	<table border="1"> <thead> <tr> <th>Before</th><th>After</th></tr> </thead> <tbody> <tr> <td>SP-1 → [ ]</td><td>SP-1 → [ ]</td></tr> <tr> <td>SP → [ ] ← A</td><td>SP → [ ] ← A (= pc+1)</td></tr> <tr> <td>SP+1 → [ ] ← B</td><td>SP+1 → [ ] ← B</td></tr> </tbody> </table>	Before	After	SP-1 → [ ]	SP-1 → [ ]	SP → [ ] ← A	SP → [ ] ← A (= pc+1)	SP+1 → [ ] ← B	SP+1 → [ ] ← B
Before	After								
SP-1 → [ ]	SP-1 → [ ]								
SP → [ ] ← A	SP → [ ] ← A (= pc+1)								
SP+1 → [ ] ← B	SP+1 → [ ] ← B
