Introduction

The Zylin ZPU is the worlds smallest 32 bit CPU with GCC tool chain. The ZPU is a small CPU in two ways: it takes up very little resources and the architecture itself is small. The latter can be important when learning about CPU architectures and implementing variations of the ZPU where aspects of CPU design is examined. In academia students can learn VHDL, CPU architecture in general and complete exercises in the course of a year. The current ZPU instruction set and architecture has not changed for the last couple of years and can be considered quite stable. This shall be presented in detail the following chapters.

Part of this work is based on previous work done by Álvaro Lopes - alvieboy@alvie.com (see legal notice) on the ZPUino – a derivative work of the original ZPU core by Øyvind Harboe - oyvind.harboe@zylin.com. The original ZPUino can be found on the internet on the following website: http://www.alvie.com/zpuino. Furthermore, the original ZPU and the "ZPU Project" can also be found on the internet on the following website: https://github.com/zylin/zpu.

Instruction Set Summary

Stack Operation Definitions

```
TOS = Top Of Stack = SP
mem[SP] = valid data = stackA

PUSH:
    SP = SP - 1;
    mem[SP] = data;

POP:
    data = mem[SP];
    SP = SP + 1;
```
